

The Literature Survey/Review Assessed Exercise (20%)

Task Overview:

The task of this exercise is for you to conduct a literature search and critique of 5 research papers in Computing Science in **one** of these research topics:

- Facial expression recognition (e.g., state-of-the art models, challenges, application areas, ethical concerns, etc.)
- Artificial intelligence in healthcare (e.g., Interaction experimental designs, methods for classifying healthcare conditions, approaches for automatically detecting behaviour for health diagnostics, etc.)
- Computational models in chatbot applications (e.g., modelling language input and feedback, comparisons between different chatbot systems, application areas, challenges, etc.)
- Computer vision and deep learning for pedestrian detection. (e.g., methods using DNNs or similar for detecting and classifying pedestrians, application areas, smart cities, etc.).
- Face and gesture synthesis (e.g. face synthetic datasets, GANs and similar methods for synthesising facial expressions, ethical concerns, etc.

You may choose any-subtopic under these research areas — this includes the design of applications for them, user experience research, technical/systems research, etc.

Specific Task Information:

-Select a topic from the list above (including any sub topic)

-Find 5 research papers in the topic selected.

The papers must each be peer-reviewed, and at least 6 pages long. You **do not need** to confirm with me that your chosen papers are appropriate; indeed, part of the challenge is to choose appropriate papers.

Your task is to produce a summary/critique of each paper using the template provided:

Create a copy of this template and complete it by writing responses in your own words to the asked questions (select “file” then “make a copy”).

Word limits are stated for each question asked - you should not exceed these (*writing within word limits is itself a research skill to learn and practice!*).

After each response please provide a count of the number of words in your response (an example of this is shown throughout the template).

You must give your essay a title that summarises the topic you are addressing.

Failure to use/follow this template will result in a two-band reduction in your mark for this assignment (*using/following a provided template is another academic skill to practice*).

After completing the task you are asked to write a reflective summary [maximum 150 words] outlining which question in the template you found the most difficult to answer. A place for you to write this is provided at the start of the template.

This reflective paragraph will not be explicitly marked for quality, but if you do not submit a paragraph demonstrating your understanding of your submission you will automatically lose two bands for this assignment (i.e. if your assignment is awarded a B3, a C2 will be recorded as your grade).

Submission details

Every team lead needs to submit **one .pdf** file containing your literature survey and all paper summaries as a group report. Only the team lead needs to submit this group report. Every team member/ individual also needs to submit **an individual report** stating every team member contribution to the project (ideally it should be equal participation). Submit your coursework using Moodle, following the instructions provided. Students who fail to submit the individual report will incur a one band deduction in the grade for this assignment.

You assessment will be marked according to the following criteria grid:

Grade	Topic and Paper Choice	For Each Paper
A (Excellent)	Topic is highly appropriate for Computing Science; all five papers are relevant research papers addressing the same topic	Clear and wholly correct summary. Highly insightful critique, drawing on external knowledge and/or sources
B (Very Good)	Topic is appropriate for Computing Science; all five papers are relevant papers, broadly covering aspects of the topic.	Very good summary and assessment of the worth of the research, making appropriate critical points
C (Good)	Topic is appropriate for Computing Science; the papers are mostly relevant, or are not clearly research papers.	The summary is good, and several interesting critical points made
D (Satisfactory)	Topic is related to (but not within) Computing Science; the papers are mostly relevant, or are not clearly research papers. The papers are individually appropriate, but are not within the same theme	The summary is satisfactory (perhaps with a few errors). Some interesting critical points made

E (Weak)	It is not clear that the topic relates to Computing Science; or none of the papers are research papers	Weak understanding of the paper. Very little critique
F/G (Poor)	Inappropriate topic, inappropriate papers	Shows little evidence of having understood the paper. No critique at all.

Important Dates:

- 12/11/25 - Release of the assignment specification
- 05/12/25 (16:30) - Deadline for submission on Moodle
